Ingressio and KeyLemon join forces to develop Identification Verification Solution based on face recognition technology

Mexico City, Mexico and Martigny, Switzerland, July 25th, 2011 – KeyLemon S.A. announced its collaboration with Ingressio the leading Identity Verification provider in Mexico. Ingressio and KeyLemon will launch one of the first Identification Verification Solution based on Face Recognition Technology. The new solution, first deployed in Financial Sector, will increase the level of security, control and efficiency.

The two companies will build the first joint prototype for the financial sector. This new solution will solve one of the main concern of identification such as such sharing, stolen and forgotten of passwords, secret codes and personal identification numbers (PINs). Face Recognition Technology can provide higher levels of accountability than any other kind of authentication method, as it cannot be shared by co-workers and it also mitigate "walk away" risks by providing assurance that only the person who logs into a PC is the person who continues to use it, potentially eliminating the need to enforce timeouts.

Ingressio will bring its unique 10 years experience in building a solution that increase the level of security, control, efficiency, time attendance and access control.

The underlying Face Recognition Technology provided by KeyLemon, is the results of more than ten years of research and development. The technology has been short listed for the Swiss Technology Award in 2006. KeyLemon acquired unique competencies and know-how in the design and the integration of face recognition technology into simple, convenient and functional software products.

"After a long search for the right technology partner for facial recognition for desktop and mobile solutions open to work together on a long term and fruitful relationship, we are more than pleased to start this journey together with KeyLemon. We are thrilled about the innovation and added value we will build together and also about new business opportunities that will be generated for our partners and customers right from the beginning" said Humberto López, Founder and CEO, Ingressio. "It's all about making life easier and more secure, It's all about people"

"We are very excited about this collaboration with Ingressio. I believe that this will improve the existing Identification process of organizations and with Ingressio we have found the right partner. I'm thrilled by this opportunity to power Face Recognition with our technical knowhow", said Gilles Florey, Founder and CEO, KeyLemon. "This will enhance security and the user experience"

The companies plan already to extend their collaboration and are preparing solution based on Mobile Devices.

About KeyLemon

KeyLemon is a company that develops computer software based on face recognition technology. Formed in 2008, the company has its main office in Martigny Switzerland. The company provides software that simplifies access to a computer or a software application. The software has already been downloaded by over 1.5 million Internet users. Additionally, the company collaborates with several industrial partners to design and integrate face recognition technology into software products. KeyLemon has attracted significant media attention around the world, and has won a number of awards for technical innovation and excellence. For more information, visit
